Experiment 5: Request Validation Using express-validator

Aim:
To design and implement a request validation mechanism in an Express.js application using express-validator by validating name, email and age.

Procedure

1. Create project
mkdir validation-demo
cd validation-demo

2. Initialize project
npm init -y

3. Install packages
npm install express express-validator

4. Create folders
middleware/
routes/

5. middleware/validator.js

```
const { body } = require('express-validator');

exports.userValidation = [
 body('name').notEmpty().withMessage('Name is required'),
 body('email').isEmail().withMessage('Invalid email format'),
 body('age').isInt({min:18}).withMessage('Age must be at least 18')
];
```

6. routes/userRoutes.js

```
const express=require('express');
const router=express.Router();

const {validationResult}=require('express-validator');
const {userValidation}=require('../middleware/validator');

router.post('/register',userValidation,(req,res)=>{
```

```
 const errors=validationResult(req);

 if(!errors.isEmpty()){
   return res.status(400).json({errors:errors.array()});
 }

 res.send('Validation Successful');

});

module.exports=router;
```

7. app.js

```
const express=require('express');
const app=express();

const userRoutes=require('./routes/userRoutes');

app.use(express.json());

app.use('/user',userRoutes);

app.listen(3000,()=>{
 console.log('Server running at http://localhost:3000');
});
```

8. Execute
node app.js

Testing

POST
http://localhost:3000/user/register

Valid JSON

```
{
"name":"John",
"email":"john@gmail.com",
"age":25
}
```

Output
Validation Successful

Invalid JSON

```
{
"name":"",
"email":"abc",
"age":15
}
```

Output
Name is required
Invalid email format
Age must be at least 18

Result
Successfully implemented request validation using express-validator middleware.
